

Claims Analysis

Perhaps you are looking at policy buyouts, or maybe you are involved in settlement negotiations or legal disputes. You may want to create reasonable cash flow projections, or to verify that a policyholder invoice is within the terms of a formal settlement agreement or court ruling. In any of these situations you need to be able to rely on sound claims allocation and claims modelling analysis.

Axiom is uniquely qualified to assist Clients in the analysis of insurance coverage and allocation issues for long tail product and general liability claims on both direct and reinsurance accounts.

We have established a successful track record in taking on the compilation and analysis of complex insurance coverage blocks:

- ▶ Having established the current coverage trigger, we apply this to the coverage block, projecting the potential impact on coverage of the settlement of legal positions, or determining the overall or period liability for a single (re)insurer or group of (re)insurers
- ▶ The results can also be used to assist in calculating insurers' potential reserves and IBNR positions. Additionally, we can apply sensitivity analysis to determine the liability boundaries and possible exhaustions under various scenarios

▶ We have developed a specialised computer-based settlement allocation model, that enables users to perform ‘what if’ analyses for mass tort claims. System tracks policyholders’ coverage and enables users to calculate the potential liability arising from a variety of claims scenarios, and to project the economic impact of various alternative allocations and legal arguments and adapt rapidly to legislative change.

Axiom’s resources, experience and expertise in the specialist field of claims allocation and modelling analysis are second to none.

The Axiom Benefits:

- ▶ Full range of analytical and modelling techniques
- ▶ Industry leading professional standards
- ▶ Experienced and dedicated specialist team
- ▶ Detailed understanding of current market issues
